

How Student Data Is Secured From Claude's Servers

Canvas content tooling at MGCCC - a brief for instructors and administrators

When an instructor uses the Canvas tool with Claude, **only the course material being built is sent to Claude**. Student rosters, grades, and submissions are **blocked by software on the instructor's own computer** before anything could be transmitted - it is not a matter of trusting the AI.

1. The data path

Every tool request passes through a local guard first. Course content continues to Claude; anything resembling student data is stopped on the machine.

2. What actually leaves the computer

What actually leaves your computer (toward Claude)

3. Layers of protection (defense in depth)

Layer	What it does
AI policy	The assistant is instructed to refuse student data.
No risky tools	The content tool ships zero scripts that can read rosters/grades.
Local BLOCK (key)	Software denies student-data requests before they run.
Sterilizing gateway	If data is ever needed, raw stays on the PC; only scrubbed text is shown.
Output scrubber	Best-effort cleanup of stray IDs/emails (tuned to MGCCC formats).

4. Proven, not just promised

Automated protection checks

A built-in test runs **46 checks** against the exact rules the guard uses - confirming student-data requests are blocked, course content still works, and IDs/emails are scrubbed. It also **openly lists what it does not catch**. The rules are a short file an IT reviewer can read, and the block can be watched working live.

Honest scope

This is a **proof of concept**, and it is **not a literal "air gap"** (the computer still uses the internet). What is guaranteed and auditable is **local prevention**: student data is never fetched, so there is nothing to transmit. The output scrubber is a best-effort backstop, not a 100% claim. To make this an enforced, institution-wide control, the next steps are a **scoped Canvas login that cannot see grades** and **centrally-enforced settings** that users cannot disable.

Full detail: DATA-HANDLING.md and CONTINGENCY-ANALYSIS.md. The guarantee is local prevention of the student-data path; redaction is a labeled backstop.
